Delve

Requirements: Novice, Eminent Domain or System Invasion
Range: SINC x 2
Duration: Instant
Execution Penalty: -0

When wearing an AR interface device and looking at a person, your system typically displays basic information about them. This Program allows you to delve deeper, bypassing security measures to access additional private information. Successful use of this Program can grant you access to personal messages, Rep-logs, and other private data.

With a successful use, you can uncover information that the target has shared with other organizations, such as medical records, shipping logs, or business contracts stored in a business' server array.

If you succeed with a raise, you can delve into more personal communication, such as chat logs and direct messages. Additionally, a successful Delve can immediately determine if a CID (identification) is fake.

System Invasion

Requirements: Novice
Range: SINC x 3
Duration: Permanent
Execution Penalty: -2; Opposed by Target's SINC or Knowledge (Software)

With System Invasion, you launch a direct attack against another system to gain control over it. Successful use of this Program allows you to remotely control computer systems, drones, and even Apotheosized individuals with upgrades.

To use this Program, you need line of sight to the target system's main processing array or locate it through the Extranet. Locating a system through the Extranet requires a successful Knowledge (Software) roll, with heavily secure systems imposing penalties. The most secure systems not connected to the Extranet cannot be invaded this way.

When invading a stand-alone computer:

Success grants limited access to the file system, allowing you to view authorized user files.
Success with a raise provides greater access, including the ability to create new files but not edit existing ones.
Two or more raises grant complete control over the system, except for the core of the OS designed by Mimir.
When invading a drone:

Success allows you to implant a single-word command, such as "Flee!", which the drone will try to obey until the end of the scene.
Success with a raise enables implanting a simple sentence command, like "Go stand in the corner" or "Target Omniplex employees," which the drone will try to obey for an hour.
Two or more raises allow implanting a command consisting of several sentences, providing a series of steps for the drone to follow. The target will attempt to obey the command for up to a week.
Note: For further information on Mimir-tech, refer to page 71.

Raise Calculator

To use the Raise Calculator, locate the base Target Number (TN). The numbers to the right of that TN are its raises. If theTN is9, for example, the next number (13) is one raise, then 17, 21, & so on.

1	5	9	13	17	21	25	29	33	37	41	45	49	53
2	6	10	14	18	22	26	30	34	38	42	46	50	54
